  <h3 id="topics"><b>WEBSITE 101</b></h3>
  <p>Do you want to learn how to make a website like the one you are looking right now?

  Are you pondering over these sick website tricks which make it stand apart among all other sites?
  Do you want to learn more about website styling? Fret not, 'cuz <span class="title">'WEBSITE 101'</span> got you covered.
  Our website has a host of features to get you started. It doesn't matter if you are a noob who wants to develop a HTML website from scratch or you are a beginner who wants to apply various techniques to your website to make it look more appealing to the viewers, with the help of this site you can make your very own cool looking website. Here you will learn:
  </p>
  <ul>
    <li>Website basics (like what is HTML and CSS).</li>
    <li>Building HTML website from scratch.</li>
    <li>Building CSS for the built HTML.</li>
    <li>Linking HTML to CSS and embedding objects.</li>
    <li>Applying transitions.</li>
  </ul>
  <p>All this without letting any performance issues to hinder your website from reaching your users, because
  <span class="emphasis"><b>all the tricks shown here use CSS only, instead of JSS.</b></span>
  </p>

    <span class="border2">WHAT'S HTML?</span>
  </div>
</div>

<div class="banner">
  <div class="banner-caption">
    <p><span>Hypertext Markup Language (HTML)</span> is the standard markup language for documents designed to be displayed in a web browser.
    It can be assisted by technologies such as Cascading Style Sheets (CSS) and scripting languages such as JavaScript.
    Web browsers receive HTML documents from a web server or from local storage and render the documents into multimedia web pages.
  </p>
  </div>
</div>

```

HTML describes the structure of a web page semantically and originally included cues for the appearance of the document.

HTML elements are the building blocks of HTML pages.

With HTML constructs, images and other objects such as interactive forms may be embedded into the rendered page.

HTML provides a means to create structured documents by denoting structural semantics for text such as headings, paragraphs, lists, links, quotes and other items.

HTML elements are delineated by tags, written using angle brackets. Tags such as and <input /> directly introduce content into the page.

Other tags such as <p> surround and provide information about document text and may include other tags as sub-elements.

Browsers do not display the HTML tags, but use them to interpret the content of the page.

HTML can embed programs written in a scripting language such as JavaScript, which affects the behavior and content of web pages.

Inclusion of CSS defines the look and layout of content.

The World Wide Web Consortium (W3C), former maintainer of the HTML and current maintainer of the CSS standards,

has encouraged the use of CSS over explicit presentational HTML since 1997.

</div>

<div class="bgimg-3">

<div class="caption">

WHAT'S CSS?

</div>

</div>

<div class="banner">

<div class="banner-caption">

<p>Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language like HTML. CSS is a cornerstone technology of the World Wide Web, alongside HTML and JavaScript.

CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple web pages to share formatting

ing by specifying the relevant CSS in a separate .css file, and reduce complexity and repetition in the structural content.

Separation of formatting and content also makes it feasible to present the same markup page in different styles for different rendering methods, such as on-screen, in print, by voice (via speech-based browser or screen reader), and on Braille-based tactile devices. CSS also has rules for alternate formatting if the content is accessed on a mobile device.

The name cascading comes from the specified priority scheme to determine which style rule applies if more than one rule matches a particular element. This cascading priority scheme is predictable.

The CSS specifications are maintained by the World Wide Web Consortium (W3C). Internet media type (MIME type) text/css is registered for use with CSS by RFC 2318 (March 1998). The W3C operates a free CSS validation service for CSS documents.

In addition to HTML, other markup languages support the use of CSS including XHTML, plain XML, SVG, and XUL.
